

The graph behind the construction

Small instances reveal the controls, clones and domination rule.

Projective example

182 vertices · 889 edges · $q = 2$, $w = 1$

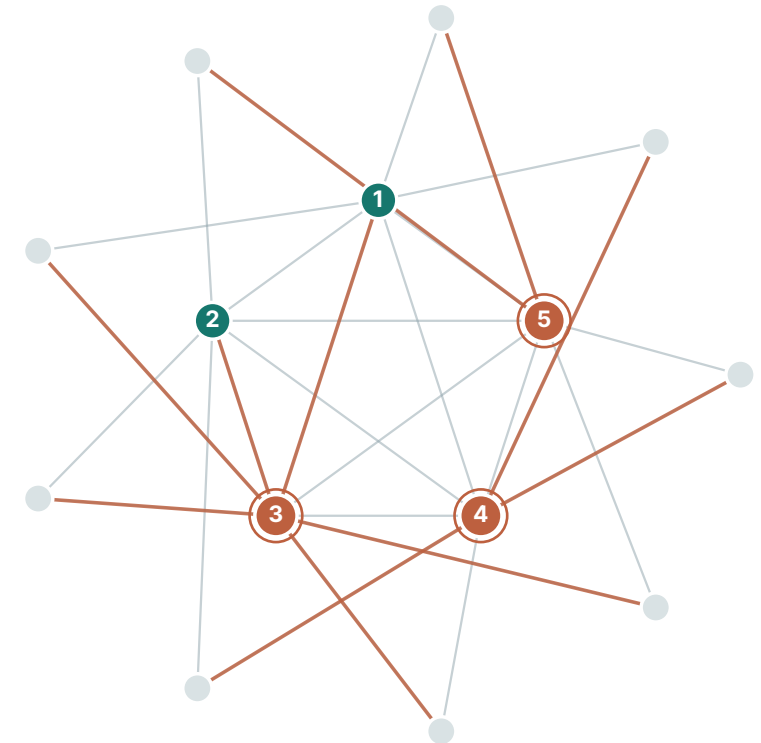

● Left controls · 14 ● Right controls · 21 ● Clones · 147

Every edge is shown. Controls form a clique; each clone has exactly two control neighbors.

Construction illustrations only. The 14-vertex example is unimodal; neither panel is a certified counterexample.

A dominating set you can inspect

14 vertices · 28 edges · 3 selected controls

The three ringed vertices dominate the graph.
Each other vertex has a highlighted edge to one of them.
